Proximal Colon by TG group

S5 Fig. Kaplan-Meier curves depicting the incidence probability for proximal colon cancer according to change in triglyceride (TG) status; normal TG-persisted (group 1), normal to HTG (group 2), HTG to normal (group 3), and HTG-persisted (group 4) groups, if incidence age > 50 then censored (p=0.003 by log-rank test). HTG, hypertriglyceridemia.
